# WHY 3D VISION IN SPACE?

- /// Accurate ranging at long distances
- /// Direct measurement of shape and distance
- /// Decisions based on actual shape, not 3D-model
- /// Independent of range and illumination
- /// Ease of segmentation

Funded by the European Union - Views and opinions expressed are however those of the author(s) only and do not necessarily reflect those of the European Union or the European Commission. Neither the European Union nor the granting authority can be held responsible for them.

# SIMULATION TOOL: EXAMPLES

## /// Main difference: Specular surfaces

- ! No data from solar panels
- ! MLI yields reduced and uneven reflectance

## /// Best performance on matte surfaces:

- ! Brushed metal
- ! Plastic & 3D print
- ! Marker plates

# 3D VISION FOR IN-ORBIT SERVICING

/// Flash-LIDAR is well-suited for rendezvous operations, until ~1m range

Very long-range

High measurement rate

Raster-free 3D

No moving parts

/// At the shortest ranges, geometric 3D is more accurate than time-of-flight

	Flash-lidar	Scanning lidar <sup>1</sup>	Structured light <sup>2</sup>	2D vision
Range	2 m - 4 km	1 m - 1.5 km	0.5 m - 1.5 m	0.5 m - 1.5 m
Accuracy	~ 1 cm	?	~ 0.1 mm	~ 1 mm
Pixel rate	10 MP/s	40 kP/s	2.5 MP/s	>> 10 MP/s
SWaP	High	Very high	Low	Very low

[1] Based on specs from Jena Optronics RVS-3000-3D

[2] Please stay for our colleague J. Thielemann's presentation on structured-light 3D! 😊
